## Permanent Power

Permanent Power systems are designed to allow the user to integrate inverter power with generator power. The inverter can produce sufficient output to run lighting circuits and small household loads.

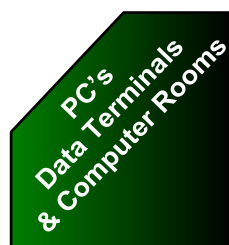

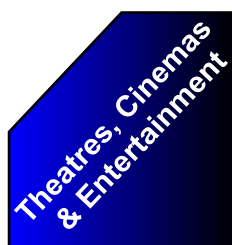

The main loads, requiring substantial power, will continue to run from the generator either via a start-on-demand system or key-start facility. The inverter will also connect its load to the generator and recharge the battery.

The illustration below incorporates a diesel generator, a Permanent Power inverter system, a rechargeable battery set and the main changeover circuit.

**Design and manufacture of  
Battery backed permanent  
power**

**Load supplies from 500VA**

**Fully automatic operation**

**Small break in supply whilst  
generator starts**

**Built in recharge facilities**

**Duration to suit operational  
time required**
